Roger Dixon

From: Jim Kilmer for the H2 targets Safety Panel

Subject: E906 Hydrogen Target Operations

The panel had a short list of issues at our last walkthrough on February 2. The experiment has taken care of those issues. At this time the panel is recommending that they be allowed to run their targets filled with liquid hydrogen or deuterium.

I'm sending this to both of you and I think both of you will be required to approve because while the target is in the experiment and in NM4 the rad fencing encloses the target and hence they really are sitting on the AD side of the rad fence.
